

JAURE®

Crowned tooth gear couplings

TYPE MT

A Regal Brand

REGAL

JAURE®.

Experience, innovation
and close cooperation
with leading international
companies.

JAURE® is a leading supplier of couplings and power transmission solutions. Experience, manufacturing program, innovation and close cooperation with leading International companies in the business enables JAURE® to provide customized solutions to our customers.

For over 50 years, JAURE® has developed couplings for the most demanding applications in marine, wind energy, steel, railway and paper industries among others.

Our manufacturing program covers a complete range without boundaries in power and speed, and we continue developing new products for future challenges.

JAURE® is part of Regal Power Transmission Solutions, a division of Regal Beloit Corporation. Regal Power Transmission Solutions is comprised of 8 brands: Browning, Jaure, Kop-Flex, McGill, Morse, Rollway, SealMaster and System Plast. Particularly the integration of Kop-Flex and Jaure coupling businesses has strengthened Jaure's presence worldwide and has added application expertise to provide answers, products and service to our customers on a global basis.

MT Gear Coupling Introduction

JAURE MT Crowned Tooth Gear Couplings

Jaure was founded in Spain in 1958 as a machining workshop in one of the most industrialized areas with strong steel and iron tradition. Jaure's flexible coupling manufacturing activity as it is known nowadays started back in 1970 with the production of the first gear coupling MS model.

Along the last 50 years, the design of Jaure gear coupling has been continuously improved from, MS serie, to MN, then HA until the nowadays known Jaure MT gear coupling.

Below equivalences of the various models of Jaure gear coupling:

Industrial MT	Marine MT	HA	MS	MN
52	42	10	5	5
62	55	15	10	10
78	70	20	20	20
98	90	25	35	35
112	100	30	60	60
132	125	35	105	105
156	145	40	150	150
174	165	45	210	210
190	185	50	325	325
210	205	55	430	430
233	230	60	600	600
275	260	70	800	800

Thousands of Jaure gear couplings are operating today in the toughest applications such as steel mills, pulp and paper, mining, cement, marine drives, wind turbines, etc.

MT gear couplings are the most compact coupling solution for critical applications that demand high torque transmission.

Main advantages of MT gear couplings

- Jaure® couplings offer maximum torque capacity. This is due to the optimum pitch diameter of the gears, providing reliability.
- High permissible hub bore allows more favorable size selection of the coupling for a certain shaft diameter. This offers an important economic saving.
- High permissible additional loads for starting and short-circuit peak torque.
- Highest gear accuracy and quality thanks to the production improvements obtained with new CNC gear cutting machines and automatic charge systems.
- The design, manufacture and sale of all Jaure's gear couplings and drive components are integrated into Jaure's Quality System. This is according to ISO 9001 and certified by DET NORSKE VERITAS (DNV).
- The Jaure MT standard range meets the AGMA standard, meaning that the MT coupling sleeves and drilled holes will fit any AGMA coupling halves. This ensures the interchangeability by coupling halves.

Custom made couplings

Special designs according to customer needs often come from close co-operation with our R&D and Engineering departments. Special solutions are normally based on the use of special seals and alloyed steels subjected to surface hardening treatments, such as:

- Nitriding
- Case carburizing
- Induction hardening

In addition to our R&D department validation procedures, MT gear couplings are analysed by specific software based on FEA. JAURE also collaborates with Technological Centres, which combined with our worldwide network of technical experts, enables us to provide innovative engineered solutions to our customers.

Marine Type Approval & Manufacturing Survey Arrangement

The Jaure MT gear couplings can be also delivered on demand with the 3.2 certificate of any Marine Classification Society.

Jaure is besides awarded with the Manufacturing Survey Arrangement – MSA from DNV. The MSA certificate is our commitment to continuously improve the service and response time to our customers and remain competitive in the market place.

MT Gear Coupling Description

The MT gear coupling is a steel double-joint coupling. Main function is to transmit torque and at the same time accommodate the misalignment between two shafts.

The MT coupling is torsionally stiff and formed by two crowned hubs which engage two flanged sleeves with internal straight parallel teeth (see coupling parts at Fig n°1).

Fig n°1. Coupling components

As a result of the teeth curvature, if shafts misalignment occurs, the crowned teeth hubs can oscillate in the flanged sleeve (see Fig n°2).

It is impossible to have corner pressure even at maximum misalignment. The combined tip and flank centering and fully machined coupling ensure smooth operation.

In case of high rotation speed (circumferential speeds exceeding 40 m/s or sensitive supports to unbalance) dynamic balancing is required.

The teeth are machined with precision gear machines in order to assure uniform contact on all the teeth.

Fig n°2. Detail of the crowned teeth with angular misalignment

Coupling size for certain drive depends not only on the drive unit power and speed, but also on the misalignment and the type of machines to be coupled.

Three types of misalignment can be effectively accommodated by the MT gear coupling (see Fig. n°3):

- Axial: Shafts are aligned but shaft ends are apart from each other.
- Parallel Offset: Axes of connected shafts are parallel, but not in the same straight line.
- Angular: Axes of shafts intersect at center point of coupling, but not in the same straight line.

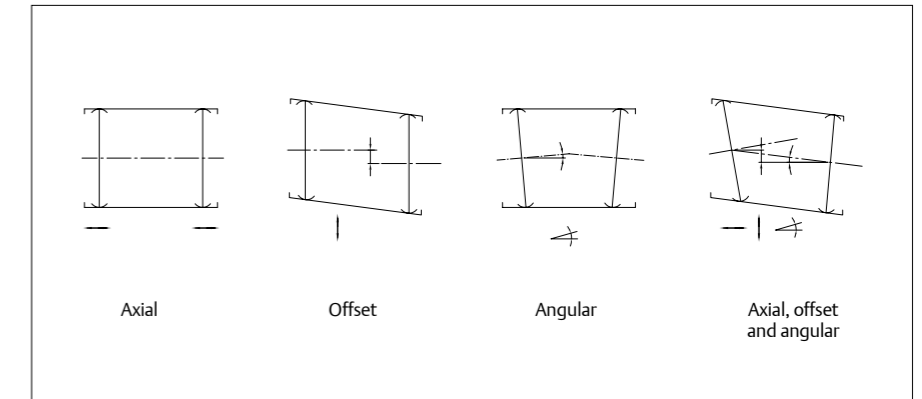

Fig n°3. Shaft misalignment

Proper maintenance of gear couplings is key to avoid early wear of the gear teeth and extend the coupling's life. It is necessary to strictly follow the installation and maintenance instructions.

The MT gear coupling must be filled with grease periodically. Therefore, the lubrication is forced into the teeth by centrifugal force. Seals are provided in the sleeves/covers to prevent any grease leakage. They can be used at -30°C to 70°C temperature range. For other temperature, please contact Jaure.

The gear couplings are made in C45/55 material as a standard. If a more compact coupling or higher power ratio is required, **Jaure Heavy Duty Type (HD)** in alloy steel is available in our program.

In addition other special designs with heat treatments such as induction hardening, gas nitriding, case hardening, etc can be delivered on demand. Please contact our engineering or sales departments.

For more detailed information refer to Jaure instruction manual.

Coupling Selection

For MT standard design selection, the following data is required:

- P_N, Installed or absorbed power (Kw)
- n, operating speed (rpm)
- L, d shaft lengths and diameters (mm)
- DBSE distance between shaft ends (mm)
- Service requirements (K service factor from page 15)
- Dynamic misalignment (F_a misalignment factor from Fig n°4)
- Additional geometrical or atmospheric restrictions

Torque Capacity varies with speed and dynamic misalignment. A coefficient (f_a = Coefficient factor from dynamic misalignment and speed) is required over 0,1 degrees of misalignment and is affected in the following trend:

Fig. n° 4 Trend of Coefficient with Dynamic Misalignment and Speed

- n = n_{max}
- .- n = 0.6·n_{max}
- ... n = 0.4·n_{max}
- n = 0.15·n_{max}

Above graph shows one gear mesh misalignment.

Values shown in the graph are indicative. For accurate calculation or higher angular misalignment please contact Jaure.

Selection procedure

1) Calculate nominal torque T_N (Nm) as follows:

$$T = 9550 \frac{P_N \cdot K}{n \cdot F_a}$$

P_N = Max. actual power in (Kw)

n = Coupling speed in (rpm.)

K = Service factor

F_a = Misalignment factor

Select coupling size from catalogue with nominal torque capacity same or higher than obtained. Check if the peak torque of the application is below the coupling max. torque (T_{Pmax}).

2) Check in the catalogue maximum bore capacity for selected coupling. Should shafts be larger than the maximum admissible bore, select next bigger necessary size diameter.

3) Check shaft/hub connection is able to transmit the torque. If necessary, extend the hub length.

4) Speed given in catalogue is maximum value for unbalanced couplings. For higher operational speed the coupling must be dynamically balanced and other materials than carbon steels might be used. Please contact Jaure engineering for support.

5) Selection Service Factors (K): Recommended service factors are given on page 15.

The service factor can vary for each application and depending among other on:

- a. Type of driving and driven machine
- b. Reversing / Non-reversing load
- c. Peak torques

Example:

Find a coupling to connect a gearbox with the drum of a conveyor.

Motor power P_N = 400Kw.

Peak torque: 7200Nm

Drum speed n = 1.000 r.p.m.

Gearbox shaft d₁ = 80mm.

Drum side shaft d₂ = 100mm.

Dynamic misalignment < 0,1 degrees. F_a=1

Service Factor for Conveyor Heavy Duty Not Uniformly Fed Assembly in page 15, K=1.25

Solution:

$$T = 9550 \frac{400 \cdot 1,25}{1000 \cdot 1} = 4775 \text{ Nm}$$

Nominal torque needs to be checked as a first step. From MT basic design, we would select MT-78. Secondly, we need to check maximum shaft capacity for selected size. This would lead to the selection of MT-112, as the drum shaft diameter is 100 mm.

Check that Peak Torque of application 7200 Nm is below selected coupling limit (28200 in this case).

With this selection, resulting Service factor can be calculated:
Since

$$T_{\text{application}} = 9550 \frac{P_N}{n} = 9550 \frac{400}{1000} = 3820 \text{ Nm}$$

Resulting Service Factor can be calculated as

$$K = \frac{14000}{3820} = 3,67$$

Balancing

Coupling Balance requirements and limits are mainly dependent upon the characteristics of the application. For this reason balancing charts should be used as a guide only to assist in determining whether balancing is required or not.

Balancing chart is shown for average applications. For sensitive or critical application, contact Jaure for coupling balance requirement.

Balance Chart for non spacer type gear couplings

Fig. n° 5

Balance Chart for intermediate shaft couplings up to 1000mm of DBSE (For higher DBSE please refer to Jaure)

Fig. n° 6

Balancing

Minimum applications data required for chart interpretation:

1. ISO balancing Grade for the coupling. (G)
2. Application Speed (n)

This information allows to calculate the permissible eccentricity (e permissible) for the coupling.

$$e_{\text{permissible}} = 9550 \cdot G/n$$

Where,

e permissible = Permissible eccentricity of center of gravity in μm .

e coupling = Actual eccentricity of center of gravity of coupling in μm .

G = Balance Grade in mm/s

n = Application speed in rpm.

In order to satisfy the application requirement, e coupling \leq e permissible.

Balancing Practices

Jaure couplings are dynamically balanced in component level or in sub-assembly.

In case of sub-assembly balancing level, major components are match-marked to ensure the proper reassembly of the coupling.

Hubs are component balanced at finished bore without keyways unless mentioned in the order.

On special request from customer, assembly balancing of gear coupling including gear hubs can be performed.

Balancing reports will be available for customer under request.

Example:

Coupling Type – Spacer type Gear Coupling.

DBSE – 600 mm

Required Balance Quality – 6.3

Application Speed – 1800 rpm

As per the chart, we require to perform the superior balancing for the spacer coupling to achieve the 6.3 balancing grade as per ISO-1940-1.

Alternatively:

$$e_{\text{permissible}} = 9550 \cdot G/n$$

$$= 9550 \cdot (6.3)/1800$$

$$= 33,4 \mu\text{m}$$

From the chart (Y-axis) for 33,4 μm permissible eccentricity, coupling requires Superior balancing.

Critical Speed

Critical speed needs to be checked for intermediate shaft couplings.
 Note: For an approximate calculation the spacer/shaft length can be used instead of the distance between gear mesh.

Fig n°7
 Critical speed for intermediate shaft couplings type MTX and MTXCO.

Ex.: MTX-98 with a spacer of 3575 mm can rotate at a speed maximum 1000 rpm

Fig n°8
 Critical speed for intermediate shaft couplings type MTD.

Ex.: MTD-78 with an intermediate shaft of 2350 mm can rotate at a speed maximum 1000rpm

Recommended Service Factors (K)

Values listed are intended only as a general guide, and are typical of usual service requirements. For systems which frequently utilize the peak torque capability of the power source, verify that the magnitude of this peak torque does not exceed the 1.0 Service Factor Rating of the coupling selected. Applications which involve extreme repetitive shock or high-energy load absorption characteristics should be referred -with full particulars- to JAURE.

Values contained in the table are to be applied to smooth power sources such as electric motors and steam turbines. For drives involving internal combustion engines of four or five cylinders, add 1.0 to the values listed; for six or more cylinders, add 0.5 to the values listed. For systems utilizing AC or DC Mill Motors as the prime mover, refer to Note (1).

CAUTION: All people moving applications must be referred to engineering.

From size 174 (included) the coupling is supplied by default with puller holes. If required, puller holes can also be made for smaller sizes.

Setscrews can be included upon request. Adapted hub length available upon request.

ATEX certifications are available. Please, contact JAURE to define the zone and category.

(1) The torque of the coupling does not include the connection transmission capacity.

(2) Minimum dimensions refer to already machined bore.

For A00 rough bore dimensions contact Jaure.

(3) Max. allowable bore for couplings with DIN 6885/1 keys.

For other types of keys or connections please contact JAURE.

(4) Clearance to align coupling hubs and replacement of sealing rings.

(5) Weight and moment of inertia are given for minimum bore.

(6) Weight is given for maximum bore.

(7) The amount of grease indicated in the catalogue is for guidance only.

For exact amount please refer to coupling instructions.

(8) n MAX speed for balanced couplings. For higher speeds contact Jaure.

Technical modifications reserved

Jaure gear couplings are used in a variety of demanding applications since years. Paper mill, cranes, pumps, conveyors and any process in a steel, aluminum or cooper mill are just some of the examples where Jaure gear couplings are performing successfully.

Numerous designs and coupling sizes are available. The custom-made gear coupling offering is developed in close collaboration with the customer.

From size 174 (included) the coupling is supplied by default with puller holes. If required, puller holes can also be made for smaller sizes.

Setscrews can be included upon request. Adapted hub length available upon request.

ATEX certifications are available. Please, contact JAURE to define the zone and category.

(1) The torque of the coupling does not include the connection transmission capacity.

(2) Minimum dimensions refer to already machined bore. For A00 rough bore dimensions contact Jaure.

(3) Max. allowable bore for couplings with DIN 6885/1 keys. For other types of keys or connections please contact JAURE.

(4) Clearance to align coupling hubs and replacement of sealing rings.

(5) Weight and moment of inertia are given for minimum bore.

(6) Weight is given for maximum bore.

(7) The amount of grease indicated in the catalogue is for guidance only.

For exact amount please refer to coupling instructions.

(8) n MAX speed for balanced couplings. For higher speeds contact Jaure.

From size 174 (included) the coupling is supplied by default with puller holes. If required, puller holes can also be made for smaller sizes.
 Distance to be specified by the customer. DBSE is distance between shafts ends, not between flanges.

Setscrews can be included upon request.
 Adapted hub length available upon request.

ATEX certifications are available. Please, contact JAURE to define the zone and category.

(1) The torque of the coupling does not include the connection transmission capacity.

(2) Minimum dimensions refer to already machined bore. For A00 rough bore dimensions contact Jaure.

(3) Max. allowable bore for couplings with DIN 6885/1 keys.

For other types of keys or connections please contact JAURE.

(4) Clearance to align coupling hubs and replacement of sealing rings

(5) Weight and moment of inertia are given for minimum bore and 1m DBSE.

(6) Weight is given for maximum bore and 1m DBSE.

(7) The amount of grease indicated in the catalogue is for guidance only. For exact amount please refer to coupling instructions.

(8) n MAX speed for balanced couplings. For higher speeds contact Jaure.

The coupling is supplied by default with puller holes. If required, puller holes can also be made for smaller sizes.

Setscrews can be included upon request. Adapted hub length available upon request.

ATEX certifications are available. Please, contact JAURE to define the zone and category. 

(1) The torque of the coupling does not include the connection transmission capacity.

(2) Minimum dimensions refer to already machined bore.

For A00 rough bore dimensions contact Jaure.

(3) Max. allowable bore for couplings with DIN 6885/1 keys.

For other types of keys or connections please consult JAURE.

(4) Distance to be specified by the customer.

DBSE is distance between shafts ends, not between flanges.

(5) Weight and moment of inertia are given for minimum bore and 2.5 m DBSE for full MTGD coupling.

(6) Weight is given for maximum bore and 2.5 m DBSE for full MTGD coupling.

(7) The amount of grease indicated in the catalogue is for guidance only.

For exact amount please refer to coupling instructions.

(8) n MAX speed for balanced couplings. For higher speeds contact Jaure.

From size 174 (included) the coupling is supplied by default with puller holes. If required, puller holes can also be made for smaller sizes.
Anti-fall system version can be supplied on demand.
Setscrews can be included upon request.

Adapted hub length available upon request.

ATEX certifications are available. Please, contact JAURE to define the zone and category.

(1) When calculating the nominal torque of the coupling neither the connection nor the braking system are considered.
For more details, please, contact JAURE.

(2) Minimum dimensions refer to already machined bore.
For A00 rough bore dimensions contact Jaure.

(3) Max. allowable bore for couplings with DIN 6885/1 keys.
For other types of keys or connections please contact JAURE.

(4) Clearance to align coupling hubs and replacement of sealing rings.
(5) Weight and moment of inertia are given for minimum bore.
(6) Weight is given for maximum bore.
(7) The amount of grease indicated in the catalogue is for guidance only.
For exact amount please refer to coupling instructions.

(8) When calculating the maximum allowed speed, we just consider the type of material of the brake drums EN-GJL-250. For other speed or

materials, please, contact JAURE.
(9) l1 can be supplied with different length on demand.
(10) n MAX speed for balanced couplings. For higher speeds contact Jaure.

For A00 rough bore dimensions contact Jaure.

(3) Max. allowable bore for couplings with DIN 6885/1 keys.

For other types of keys or connections please contact JAURE.

(4) Weight is given for minimum bore.

(5) Weight is given for maximum bore.

(6) Maximum torque transmitted through bolted joints.

(7) Body fitted bolts (Grade 10,9) are used.

(8) Special version available for flying drive applications with bending moments.

Jaure marine style gear couplings are operating for years in a variety of applications such as main propulsion & maneuvering of vessels, dredging including underwater use, fire fighting pumps, winches...

MARINE TYPE APPROVAL & MANUFACTURING SURVEY ARRANGEMENT

The Jaure MT gear couplings can be also delivered on demand with the 3.2 certificate of any Marine Classification Society.

Jaure is additionally awarded with the Manufacturing Survey Arrangement – MSA from DNV. The MSA certificate is our commitment to continuously improve the service and response time to our customers and remain competitive in the market place.

From size 185 (included) the coupling is supplied by default with puller holes. If required, puller holes can also be made for smaller sizes.

Setscrews can be included upon request. Adapted hub length available upon request.

ATEX certifications are available. Please, contact JAURE to define the zone and category.

(1) The torque of the coupling does not include the connection transmission capacity.

(2) Minimum dimensions refer to already machined bore.

For A00 rough bore dimensions contact Jaure.

(3) Max. allowable bore for couplings with DIN 6885/1 keys. For other types of keys or connections please contact JAURE.

(4) Clearance to align coupling hubs and replacement of sealing rings.

(5) Weight and moment of inertia are given for minimum bore.

(6) Weight is given for maximum bore.

(7) The amount of grease indicated in the catalogue is for guidance only.

For exact amount please refer to coupling instructions.

(8) n MAX speed for balanced couplings. For higher speeds contact Jaure.

From size 185 (included) the coupling is supplied by default with puller holes. If required, puller holes can also be made for smaller sizes.
Distance to be specified by the customer. DBSE is distance between shafts ends, not between flanges.

Setscrews can be included upon request.
Adapted hub length available upon request.

ATEX certifications are available. Please, contact JAURE to define the zone and category.

(1) The torque of the coupling does not include the connection transmission capacity.
(2) Minimum dimensions refer to already machined bore. For A00 rough bore dimensions contact Jaure.
(3) Max. allowable bore for couplings with DIN 6885/1 keys. For other types of keys or connections please contact JAURE.

(4) Clearance to align coupling hubs and replacement of sealing rings.
(5) Weight and moment of inertia are given for minimum bore and 1m DBSE.
(6) Weight is given for maximum bore and 1m DBSE.
(7) The amount of grease indicated in the catalogue is for guidance only. For exact amount please refer to coupling instructions.
(8) n MAX speed for balanced couplings. For higher speeds contact Jaure.

Shaft Connections Types

Recommendations For Shaft/Bore Fits

The following recommendations, according to ISO, are given for shaft/bore fits.

TYPE OF FIT	SHAFT TOLERANCES	BORE TOLERANCES
Interference fits with parallel keyway	h 6	S 7
	k 6	M 7
	m 6	K 7
	n 6	J 7
	p 6	H 7
Shrink fits* without parallel key	u 6	H 7
	v 6	
	x 6	

* The stresses on the hub must be checked. For other types of connection please consult our technical department. For one keyway a keyway tolerance width ISO P9 is recommended. For double keyway ISO JS9 is recommended.

Axial Forces Induced By Gear Couplings

Gear couplings accommodate the misalignment through the sliding of the hub teeth over the sleeve teeth. This sliding imposes axial forces at the nearby bearings. This force has to be taken into account when designing the machine and the thrust bearings:

$$F_a = \frac{2x T_n \times \mu}{\varnothing p \times 0,94}$$

F_a = Axial Force (KN)
 T_n = Nominal Torque to be transmitted (KNm)
 μ = Friction coefficient ($\mu=0,05$ for good lubrication, $\mu = 0,3$ for axial lock up)
 $\varnothing p$ = Pitch diameter of the gear mesh (in meters), Take D1 from catalogue as an approximate dimension or consult Jaure for a more accurate calculation.

COUPLINGS

Product Brand Name	MT	LAMIDISC®	TCB / TCB-HD	AL-S / AL-SD / ALD	RECORD	JAUFLEX®	IXILFLEX®	COMPOLINK®	JFTL TORQUE LIMITER	JCFS	JHC
Type & Description	Gear	Disc pack	Barrel (drum type)	Gear spindles	Grid / spring type	Elastic	Elastic Link	Composite Link	Torque Limiter	Composite Shafts	Hydraulic fit (shaft couplings)

INDUSTRY APPLICATION

Metals & Heavy duty	•	•	•	•	•	•			•		•
Minerals & Mills	•	•	•		•	•			•		•
Crane & Hoisting	•	•	•		•	•			•		
Pulp & Paper	•	•			•	•	•	•		•	
Petrochemical / Oil & Gas	•	•			•	•		•		•	
Cooling Towers		•						•		•	
Machine Tools		•				•		•		•	
Marine	•	•	•			•	•	•	•	•	•
Wind Turbines		•			•	•	•	•	•	•	•
Test Benches	•	•					•	•		•	•
Railway	•	•					•	•	•		

Special safety heavy duty gas nitrided gears

LAMIDISC® Safety coupling on test bench Incl. SAFESET® (SAFESET® from VOITH TURBO)

Type Approvals (Marine & Wind).

Carbon Fibre Shaft combined with LAMIDISC® coupling.

Torque monitoring on wind turbines.

Double-gear couplings for railway.

Kop-Flex & Jaure manufacturing program

COUPLINGS

Product Brand Name	MAX-C®	HIGH PERFORMANCE PROGRAM			KOPFLEX GREASE	SERVICE
Type & Description	Heavy duty elastic coupling	GEAR	DISC	DIAPHRAGM	Gear coupling / spindle grease	Repair & maintenance program

High Performance Solutions.

Global presence

MANUFACTURING FACILITIES & ENGINEERING CENTERS

JAURE® & KOP-FLEX® engineered couplings are designed, manufactured, sold and serviced worldwide, with service provided from specification right through to installation.

All JAURE® & KOP-FLEX® facilities around the globe are state of the art, with access to a large and

experienced engineering staff focused on providing solutions for our customers' requirements.

A dedicated global sales and service team assists you to find the best choice and manage all your coupling needs.

JAURE®. Zizurkil, Spain.

Pune, India.

Nove Mesto, Slovakia.

Zhangzhou, China.

KOP-FLEX®. Baltimore, USA.

Florence, Kentucky, USA.

Rexdale / Toronto, Canada.

Apocadaca, México.

APPLICATION CONSIDERATIONS

The proper selection and application of power transmission products and components, including the related area of product safety, is the responsibility of the customer. Operating and performance requirements and potential associated issues will vary appreciably depending upon the use and application of such products and components. The scope of the technical and application information included in this publication is necessarily limited. Unusual operating environments and conditions, lubrication requirements, loading supports, and other factors can materially affect the application and operating results of the products and components and the customer should carefully review its requirements. Any technical advice or review furnished by Regal-Beloit America, Inc. and its affiliates with respect to the use of products and components is given in good faith and without charge, and Regal assumes no obligation or liability for the advice given, or results obtained, all such advice and review being given and accepted at customer's risk.

For a copy of our Standard Terms and Conditions of Sale, Disclaimers of Warranty, Limitation of Liability and Remedy, please contact Customer Service at 1-800-626-2120. These terms and conditions of sale, disclaimers and limitations of liability apply to any person who may buy, acquire or use a Regal Beloit America Inc. product referred to herein, including any person who buys from a licensed distributor of these branded products.
